

NEW ABSTRACT

A reproduction device ~~{200}~~ is arranged to conditionally block the reproduction of a particular content item ~~{324}~~. The reproduction device has a an obtaining unit ~~{202}~~ to obtain a content reference identifier ~~{330}~~ identifying the particular content item ~~{324}~~ and a storage unit ~~{204}~~ for storing the content reference identifier ~~{330}~~. A resolution process regularly checks on the basis of the content reference identifier ~~{330}~~ whether the particular content item is scheduled to be available, e.g. is scheduled for broadcast. When the scheduled broadcast of the particular item has been established, a blocking unit ~~{210}~~ blocks the reproduction device for that scheduled broadcast.
